

Task-Action CallingGraph Structural Delta Intelligence and Growth

TACG-SDIG v1.0.0 - ResearchGate One-Page Overview

Structural Delta Intelligence for AI Coding, structural growth, evolution memory, and governance

Key Idea. TACG-SDIG treats meaningful structural change as a first-class knowledge object. Instead of generating a solution from the whole program space, the runtime localizes the closest known Task/Action CallingGraph neighborhood, applies **Graph Minus** to isolate what is missing, searches historical Task-side and Action-side deltas, reconstructs a candidate change, validates feasibility, reachability, counter-evidence, policy, and security, and folds successful growth back into structural memory.

Canonical loop: Folded Knowledge -> Localization -> Graph Minus -> Delta -> Two-Way Search -> Unfold / Reconstruct -> Validate -> Grow -> Fold Back

Core principles: Delta is a first-class structural knowledge object. Search before generation. Structures describe states; deltas describe change; trajectories describe evolution.

Core Research Articles

- 001 From CallingGraph Knowledge to Structural Delta Intelligence
- 002 Four Structural Planes and the Canonical Knowledge Model
- 003 Graph Minus and Task-Action Delta Isolation
- 004 Two-Way Delta Localization, Search, and Candidate Reconstruction
- 005 Delta Memory, Folding, and Structural Evolution Trajectories
- 006 Delta-Scoped Structural Governance and Security
- 007 From Human Engineering Practice to AI Coding Growth
- 008 Delta Intelligence and Per-Node Intelligence

Canonical Figures
